

RED SQUIRREL CLASS – MATERIALS AND THEIR PROPERTIES

Key Vocabulary

materials	The substance that something is made out of, e.g. wood, plastic, metal.
solids	One of the three states of matter. Solid particles are very close together, meaning solids, such as wood and glass, hold their shape.
liquids	This state of matter can flow and take the shape of the container because the particles are more loosely packed than solids and can move around each other. E.g. water / milk.
gases	One of the three states of matter. Gas particles are further apart than solid or liquid particles and they are free to move around. A gas fills its container, taking both the shape and the volume of the container. E.g. oxygen / helium.
melting	The process of heating a solid until it changes into a liquid.
freezing	When a liquid cools and turns into a solid.
evaporating	When a liquid turns into a gas or vapour.
condensing	When a gas, such as water vapour, cools and turns into a liquid.
conductor	A conductor is a material that heat or electricity can easily travel through. Most metals are both thermal conductors (they conduct heat) and electrical conductors (they conduct electricity).
insulator	An insulator is a material that does not let heat or electricity travel through them. Wood and plastic are both thermal & electrical insulators.
transparency	A transparent object lets light through so the object can be looked through, for example glass or some plastics.

Key Knowledge – dissolving

A solution is made when solid particles are mixed with liquid particles. Materials that will dissolve are known as soluble. Materials that won't dissolve are known as insoluble. A suspension is when the particles don't dissolve- a completely airless space.

Sugar is a soluble material.

Sand is an insoluble material.

Changes of State

The solid melts.

The liquid freezes.

The gas condenses.

The liquid evaporates.

Changing and separating materials

Reversible changes, such as mixing and dissolving solids and liquids together, can be reversed by:

Smaller materials are able to fall through the holes in the sieve, separating them from larger particles.

The solid particles will get caught in the filter paper but the liquid will be able to get through.

The liquid changes into a gas, leaving the solid particles behind.
